Algebra 1 Direct Variation Answer

The equation $y=4x+1$ represents a linear function. When you input values of x , you get an output answer or y . To make a table, enter values of x and solve for y . A typical table may look like this: X Y-3 -11-2 -7-1 -3. 0 1. 1 5. 2 9. 3 13. To make a graph of the function, first sketch your x and y axis.

Direct Variation is a relationship that can be represented by a function in the form, where is the constant of variation for a direct variation. is the coefficient of . The equation is in the form , so the equation is a direct variation. The constant of variation or is Therefore, the answer is,

How to find direct variation - Algebra 1

For example, is I plug in 1 for x , I would get $y = 5$. Plug in 2 for x , you get $y=9$ So simply do as much as you want until you are satisfied. So to GRAPH it, you can have find two points and connect it. Because I know this function is linear (straight line). When $x = 1$, $y =5$. When $x = 2$, $y = 9$ So the two points could be (1,5) and (2,9).

Algebra 1 Direct And Inverse Variation Worksheets

Step 1: Write the correct equation. Direct variation problems are solved using the equation $y = kx$. Step 2: Use the information given in the problem to find the value of k . In this case, you need to find k when $x = 9$ and $y = 6$. Step 3: Rewrite the equation from step 1 substituting in the value of k found in step 2.
