The basic idea and performance of an Arduino board are to take input signals (be it code, from the environment, etc.) and convert them into output signals (responses and actions). One can do all this by programming Arduino through its software Arduino IDE and modifying its hardware (the Arduino board), as needed.

In my last tutorial, I explained why it is easy to work on electronic projects with Arduino. In this tutorial I will be using an Arduino board to make a simple circuit, one that can turn on a LED light. Using some more basic code I will make the same LED light blink. Finally, I will add a push-button and use it to speed up the blinking.

Programming The Arduino. Reading the analog pin on an Arduino is quite simple. The pins labeled A0 - A5 on the Arduino are special pins that when read with the analogRead() function will return the value from 0 to 1023 where the input voltage is from 0V to 5V. As the value of R1, the thermistor, changes based on the temperature, the voltage into the A0 pin will change predictably between 0V ...
