### **Carnivorous Plants In The Wilderness**

Plants are eaten by herbivores and herbivores, in turn, are eaten by carnivores. Carnivorous plants have reversed the order of this normal hierarchy that exists within the ecosystem. Charles Darwin was one of the first to demonstrate, with convincing evidence, that some plants had indeed been adapted to the carnivorous habit.

Carnivorous Plants in the Wilderness,  
Color Photography Edition By Makoto  
Honda. This is a book on the ecology of  
carnivorous plants, their lifestyle and  
surroundings. Through millions of years  
of evolution, carnivorous plants have  
acquired special adaptations that may  
appear quite bizarre and eccentric in the  
seemingly docile world of the ...

The mother devil gives birth to her tiny, undeveloped babies, called imps, which are pink and hairless, and remain in her pouch for close to four months. Amazingly enough, about 50 are born in one litter! The imps must race a distance of about 3 inches (7.6 centimeters) from the birth canal to the mother's rear-facing pouch, using their well-developed claws, where they compete to attach ...

Plants are mainly multicellular organisms, predominantly photosynthetic eukaryotes of the kingdom Plantae. Historically, plants were treated as one of two kingdoms including all living things that were not animals, and all algae and fungi were treated as plants. However, all current definitions of Plantae exclude the fungi and some algae, as well as the prokaryotes (the archaea and bacteria).

Plants have other ways of obtaining nitrogen in a nitrogen-limited environment, such as eating insects. The California pitcher plant, *Darlingtonia californica*, is a rare carnivorous plant of serpentine wetland communities. California pitcher plant obtains its nitrogen by decomposing insects captured in the pitcher-shaped leaves.
