### Gantry Crane Design Calculations

Final design of the crane structure considering the selected alternative 1.2 Scope This study will be limited to the structural calculation of the gantry crane based on the design requirements. However, they are outside the scope of this project: The calculation of the connections between the different structural elements.

Proposed design of the gantry crane chassis. After proper calculations, the results for static as well as dynamic analysis are obtained. In static analysis, crane's self weight, payload, hook weight and trolley weight are considered whereas velocities, acceleration and braking are considered in dynamic analysis.

A gantry crane spanning 300 inches has a deflection of a half an inch (.5 inches). To determine the deflection for a jib crane, the equation remains the same, but the terminology can also differ from system to system, and the deflection limits differ once again. Some manufacturers will refer to the length or span of the jib as the "reach".

This report covers the design of a portable gantry hoist with a custom frame design. The design was based off of the materials that were available and practical for this project to save money. The portable gantry hoist will be rated for a 2 ton capacity. The casters, trolley, and hoist were the only parts purchased.

the design of gantries. On the other hand there are many aspects of gantry design which are not addressed. In general, the somewhat sparse and inadequate code guidelines must be substantially augmented by practical rules and considerations which have been accumulated over many man-years of design experience.

B. Design Factors: Spanco A-Series Gantry Cranes are designed with a factor of 15 percent of the rated capacity for hoist and trolley weight and 25 percent of the rated capacity for impact. This design provides a margin to allow for variations in material properties, operating conditions, and design assumptions.
