In the context of open channel flows $Fr < 1$ implies subcritical flow, $Fr > 1$ supercritical flow, and $Fr = 1$ critical flow. This approach is directly analogous to the Mach Number (M) description of a compressible flow. This defines the ratio of the gas velocity to the sonic velocity, such that $M < 1$ implies subsonic flow and $M > 1$ supersonic flow.

open channels, R can be approximated by the mean flow depth (d), which is equal to the flow area (A) divided by the top width (T). In the absence of local hydraulic controls, the hydraulic gradient is usually equal to the channel slope for high in-bank flows. Some equations also include a roughness parameter to account for the different
