An atom is the smallest unit of ordinary matter that forms a chemical element. Every solid, liquid, gas, and plasma is composed of neutral or ionized atoms. Atoms are extremely small, typically around 100 picometers across. They are so small that accurately predicting their behavior using classical physics—as if they were tennis balls, for example—is not possible due to quantum effects.

The van der Waals radius of an atom is characteristic for each type of atom/element. As mentioned earlier, it is only under conditions of extreme temperature and pressure that the nuclei of two atoms can fuse together to form a new type of atom; such a nuclear/atomic fusion event results in the interconversion of matter into energy. Absolute zero (0 K or -273.15 °C) is a theoretical minimum, in which atoms would stop moving, and cannot be achieved. However, thanks to cryocooling refrigeration techniques, we can come close, in the range of a billionth of 1 K. Surprisingly cold! But never absolute zero. The idea of absolute zero was actually pioneered by Robert Boyle ...
